Short summary and insights on AI coding

This project demonstrates how AI coding assistants (Gemini, ChatGPT and GitHub Copilot) transformed a basic web crawler into a production-grade tool through refinement. The prerequisite for learning to use AI as a tool is to ask precise questions。
By continuously refining needs and instructions and uncovering the essence of the problem, we can obtain accurate answers. In the collaborative process, treat AI as a super assistant for basic tasks such as information gathering and data organization, allowing it to amplify rather than replace your thinking. Ultimately, we need to remember that AI only provides a reference, and we still need to retain decision-making and in-depth thinking, adjusting it according to our own needs. AI can not provide absolutely correct answer or coding, thus we need to analyze the behavior of AI and improve it through our own cognition and the results of the code.
